The **auto version** is frequently to be found in maintenance work. The strength of the auto version lies in the creation of circuit diagrams which can be adjusted when a machine or system already exists and requires medium-scale enhancement. It is also particularly well suited to create plans for small to medium-sized projects. The user can benefit from a variety of auto functions such as hyperlink generation, terminal diagrams, numeration and creation of contact diagrams.

The **mega version** is used in the planning, development and documentation of new projects. The user can make use of a whole variety of online and monitoring functions which are vital for any new project planning.
